

I am impressed with VC-9 and H.264 coding demonstrations. (The E-VSB demonstrations are also interesting.) It seems right to me that both coding schemes be authorized for 8VSB (and for E-VSB if adopted). I do not think it best to wait, and I don't expect the FCC would be critisized (as it was regarding AM stereo) for taking a "market" approach. I believe there are separate markets for each coding scheme, and that both markets would be served.
